Overview

What typically prompts finance teams to rethink their billing approach?

In our experience, it's rarely a proactive decision. More often, it's triggered by a breaking point – a merger introducing new subsidiaries, a PE investment demanding tighter financial controls or the realization that finance spends more time reconciling data across systems than analyzing it and optimizing workflows.

In many businesses, billing wasn't originally designed with finance in mind. It evolved around market dynamics and the specific terms that sales offered to customers to win their business. This led to complexity in pricing, commercial terms and how they are processed. It also left the billing functions spread across multiple systems as the company grew. This creates a disconnect: finance is ultimately responsible for revenue accuracy but lacks direct control over much of the data that drives it.

When billing becomes fragmented, finance leaders are often left searching for ways to transact while maintaining control, accuracy and efficiency. This can make it difficult for them to support business growth.

This question grows more complex for B2B companies in SaaS, fintech and technology, where revenue structures change frequently. For example, customer contracts might evolve from fixed subscriptions to usage-based pricing. Acquisitions add new entities requiring consolidated financials. Monetizing new offerings (like **AI-based services**) creates additional complexity in revenue recognition. Suddenly, the location of your billing function directly impacts your ability to:

- ◆ Maintain accurate revenue recognition (aligning billing with accounting standards)
- ◆ Produce audit-ready financials (with clear data trails)
- ◆ Forecast with confidence (using complete, real-time data)
- ◆ Automate financial processes (instead of relying on spreadsheets and manual workarounds)

About  **Zone&Co**

“The challenge with growing businesses is finance processes can become disparate across multiple tools – each one a point of risk if it's not underpinned with control.”

– **James Hewitt**, Finance leader and NetSuite ERP expert

Every financial process that's located outside the ERP creates an additional point of failure. Billing is no exception.

At Zone, we understand this challenge firsthand. Our leadership, product and sales teams include former accountants, finance leaders and CFOs who've spent their careers optimizing financial systems – and have seen how disconnected billing, reconciliation gaps and fragmented reporting make finance harder than it needs to be.

We know what CRMs and ERPs can (and can't) do. That's why we build finance automation solutions that live inside NetSuite (not bolted onto it) and connect to best-in-class systems – keeping billing, revenue and financial operations inside a single source of truth: your financial home.

We've spent more than a decade working with finance teams across the spectrum – from those using fully integrated **ERP** billing to those relying on **CRM**-based or external billing tools. Through this experience, we've observed clear patterns in what works, where friction emerges and how finance leaders **evaluate whether CRM-based, integrated or ERP-embedded billing fits their reliability and scalability needs.**

This paper examines the realities of where billing lives in your tech stack, not as a theoretical exercise but through the lens of real-world finance team experiences. Drawing on genuine examples and insights from finance leaders (including those who've learned these lessons firsthand), our goal is to help you assess your own billing approach and decide if it truly serves your finance function's needs today and in the future.

Five realities finance teams face in billing

1. Finance feels the billing pain first, but rarely controls the fix.

When billing “breaks” – whether due to rising volume, new pricing models or business expansion – finance absorbs the impact first. Yet finance often doesn't own the billing system or process, creating a gap between who feels the pain and who is able to solve it.

Does this sound familiar? Sales teams configure complex deals in a CPQ or CRM system without considering how revenue recognition will work, leaving finance to clean up the aftermath. Every month, you find yourself manually adjusting revenue schedules or invoice line items because the billing data from upstream systems doesn't align with the actual contract terms. It feels like you're constantly patching a process that you had no part in designing.

"You don't realize how broken your billing process is until you have to scale it. The moment billing complexity increases – whether it's a new pricing model, an acquisition or international expansion – finance feels it first. Suddenly, they're scrambling to patch reporting gaps, clean up revenue schedules and prove out audit trails."

– **James Hewitt**, Finance leader and NetSuite ERP expert

2. Multiple systems create multiple versions of the truth.

When contract details, billing schedules and revenue recognition rules live in different systems, which one is the definitive record? Without a single source of truth, finance teams spend countless hours reconciling discrepancies, tracking down missing information, and manually updating reports.

We frequently hear about audit challenges stemming from this issue. Teams spend weeks trying to recreate the linkage between: the contracts in their CRM, the invoices in their billing platform and the revenue schedules in their ERP.

When auditors ask for a clear trail from a customer agreement all the way to recognized revenue, can your current setup provide it? Or are you essentially rebuilding that audit trail in Excel each time?

3. Contract complexity exceeds billing system capabilities

B2B contracts rarely fit the "simple subscription" mold. Most involve multiple products or services with different billing cadences, revenue structures and compliance requirements. If your billing system treats these as separate unrelated transactions (instead of part of a unified contract), finance has to manually piece together the full picture later.

Many finance leaders we work with describe this challenge in similar terms: "We don't have vanilla subscriptions – our deals include fixed recurring fees, usage-based charges, professional services and volume discounts."

If the CRM or billing tool handles each piece in isolation while the ERP needs to recognize them collectively as one contract, the burden falls on finance to reconcile it all. Think about your process: How much time does your team spend stitching together billing data from multiple sources, ensuring revenue recognition is correct, and resolving discrepancies between usage data and contract terms?

In short, standard CRM, ERP and other billing tools often aren't equipped to handle this contract complexity end-to-end.

"In B2B, what might seem like a simple subscription is often a nuanced contract with multiple revenue streams – fixed recurring fees, usage-based charges and managed services. AI pricing models add yet another layer of complexity, making it impossible to just 'add a SKU' and expect clean billing and revenue recognition."

– **James Hewitt**, Finance leader and NetSuite ERP expert

Beyond the hidden costs of fragmented billing

Fragmented billing doesn't just create operational headaches – it has real financial implications that might not be obvious on the surface:

- ◆ **Extra headcount for reconciliation:** Companies often need 1–2 additional full-time employees just to manage the gaps between disconnected systems.
- ◆ **Extended close periods:** Month-end close can stretch 3–5 days longer as teams manually validate invoices and reconcile deferred revenue across systems.
- ◆ **Revenue leakage: Up to 5% of revenue** can slip through cracks via missed price increases, unapplied usage fees or billing errors when systems aren't unified.
- ◆ **Higher audit fees:** Audit costs can rise 15–30% due to the extra testing and documentation required for fragmented processes.
- ◆ **Delayed cash flow:** If invoicing takes 3–5 days longer because of system disconnects, days sales outstanding (DSO) grows and available cash is tied up longer.
- ◆ **Opportunity cost:** Time your finance team spends fixing process issues is time not spent on strategic analysis or business partnering.

4. Revenue recognition and billing follow different rules.

An invoice sent doesn't equal revenue earned. For many companies, especially those under ASC 606 or IFRS 15 requirements, revenue recognition follows performance obligations, not billing schedules. This fundamental distinction creates friction when billing systems can't properly track and report on revenue obligations.

Here's one example:

You're a SaaS business that sells an AI-driven service with a token consumption pricing model.

If a customer prepays for 200 AI credits but only uses 50 this month and you've agreed to credit or refund unused portions, how do you recognize all that revenue? You can't recognize all 200 upfront because of ASC 606 rules. You'd need to recognize revenue gradually as the tokens are consumed (or obligations are met), which means tracking actual usage and tying it back to your financials.

Most billing systems weren't built with this level of revenue deferral logic in mind. Finance ends up exporting usage data and crunching numbers in spreadsheets to stay compliant, effectively doing the system's job manually.

5. Forecasting becomes unreliable when billing data is fragmented.

Finance teams can't produce accurate forecasts when they lack visibility into the complete billing and revenue picture. Missing contract modifications, usage data delays and manual revenue calculations all contribute to forecast unreliability – which ultimately undermines finance's credibility with leadership.

Are your revenue forecasts consistently off because you lack real-time insight into billing and renewals?

We often hear a familiar story: by the time data from various systems is consolidated and reconciled, the month is closed – it's too late to adjust projections. Finance is left explaining variances after the fact, instead of predicting them ahead of time. A fragmented billing process essentially blinds the finance team to issues until after they've happened.

Not all companies feel these pains immediately or equally. A business with very simple billing or low volume might manage fine with separate systems for a while. But as complexity and scale increase, the gaps between siloed systems widens. What starts as operational inefficiency can quickly turn into material financial risk (e.g. revenue leakage, compliance errors or an overworked team).

Choosing the right technology: Where should billing live?

Best-in-class CRMs (like Salesforce) offer powerful tools for customer management, quoting and sales analytics. Robust ERPs (like NetSuite) provide the financial control, compliance and reporting depth that finance teams rely on.

Each system excels in its domain.

But where should billing happen? If billing is happening outside the ERP, finance often faces the kinds of challenges we outlined above. On the other hand, if billing is handled inside the ERP, will sales operations suffer?

Let's break down a common misconception: "Our CRM can probably handle billing, since it handles orders." In reality, it's more complicated.

The CRM billing reality check

Many assume their CRM platform has native billing capabilities. In truth, the CRM often lacks a few capabilities that are critical to effective billing:

- ◆ **No native invoicing:** Mainstream CRMs rarely include a true invoicing engine. If you bill in a CRM, it's usually via a separate add-on product or heavy customizations – essentially a bolt-on billing system with its own database and integration points
- ◆ **Disconnected contract structures:** A deal that looks unified in the CRM (one contract to the sales team) may be split into multiple pieces by an external billing tool. The contract structure often doesn't carry over cleanly from CRM to billing system, leading to data mismatches.
- ◆ **Separate revenue tools:** Handling revenue recognition typically requires yet another system or module. Even leading billing platforms often have a separate revenue recognition module that isn't fully integrated with billing. In short, billing in a CRM environment often still means juggling multiple tools.
- ◆ **Think about your own stack:** Are you managing an increasingly complex web of disconnected systems, with finance plugging the gaps manually?

So, where does billing belong in a best-in-class environment?

The right place for billing ultimately depends on your business model, complexity and requirements. For some companies with straightforward subscriptions, keeping billing in the CRM or a lightweight external tool may suffice. For many others (especially those experiencing growth and change), billing inside the ERP makes more sense. Below is a rough comparison based on hundreds of implementations we've seen, illustrating where billing typically fits best.

Business characteristics	ERP-based billing	CRM/external billing
Business model	Suited for B2B models with complex contracts (multiple products/services, varied billing schedules), usage or consumption-based pricing or mixed billing models.	Suited for simpler models like B2C subscriptions or point-of-sale transactions – e.g. fixed recurring charges, one product/service, straightforward pricing.
Typical industries	SaaS/technology, fintech, professional services or any industry selling multi-faceted services or subscriptions that require complex invoicing and accounting.	E-commerce and pure B2C companies, or others with low-complexity transactions and minimal revenue deferrals.
Financial requirements	Needs to meet rigorous accounting standards (ASC 606/IFRS 15), handle complex revenue recognition and multi-currency, support multi-entity consolidation and provide audit-ready records.	Only basic revenue recognition (e.g. straight-line) is needed, single-entity financials and less stringent compliance or reporting demands.
Growth trajectory	Expecting acquisitions or expansion, introducing new pricing models or product lines – in other words, significant change and growth on the horizon.	Experiencing stable, predictable growth with a consistent pricing model and product offering (no big changes on the horizon).
Expected benefits	◆ Finance maintains control of data ◆ Automated revenue recognition ◆ Strong audit and compliance controls ◆ Minimal manual reconciliation between systems	◆ Sales operations own more of the process ◆ Contract rules and billing stay within one system (the CRM) ◆ A unified workflow for the sales team ◆ Potentially simpler for front-office teams

In discussions with finance leaders who initially adopted CRM-based or standalone billing solutions, a common pattern emerges. Many believed those tools would give them an “integrated” quote-to-cash workflow. Instead, they often found themselves managing an increasingly tangled web of siloed systems, with finance having to plug holes via manual effort. Over time, as transactions grew, this approach strained their teams and introduced risk (like missed billings, invoicing errors and revenue leakage).

To evaluate your current billing setup, it may help to ask:

- ◆ Can our current billing system handle our contract complexity and revenue recognition rules?
- ◆ Where does revenue recognition actually happen in our process? (In the CRM via manual adjustments? In a spreadsheet? In the ERP?)
- ◆ How much time do we spend reconciling invoices and data across multiple systems?
- ◆ Would centralizing billing in our financial system reduce manual work and errors?
- ◆ Are we confident we're fully compliant with ASC 606/IFRS 15 using our current setup?
- ◆ Are our revenue forecasts delayed or skewed because of data gaps between sales and finance systems?

For most B2B companies with dynamic pricing and complex contracts, the question has evolved from “**CRM or ERP for billing?**” to “**How can we connect our CRM and ERP so each does what it does best?**” In other words, how can we let sales use their CRM tools seamlessly, while finance retains control and accuracy by leveraging the ERP?

The solution usually lies in tighter integration and making the ERP “own” the financial aspects of the contract.

How leading finance teams structure billing for accuracy and scale

Misaligned billing processes creates inefficiencies – but more importantly, it introduces financial risk. Revenue gets recognized incorrectly.

Forecasting becomes unreliable. Audits take longer because finance has to trace revenue back to contracts stored in disconnected systems.

Over the years, we've worked with finance teams across SaaS, fintech and other high-growth industries and the same pattern holds true: **the companies that scale successfully are the ones who keep billing inside their ERP, giving finance full control, while tightly connecting it to the sales workflow.**

So, what does that look like in practice? Finance teams that successfully scale their billing operations tend to share a few key characteristics:

1. They view billing as part of an end-to-end process, not just invoice generation.

Many businesses think their billing process works fine – until they scale and realize it's only optimized for sending invoices, not for managing the full financial lifecycle of a contract. Truly mature finance teams treat billing as part of a continuum that starts with a customer agreement and ends with fully recognized revenue and cash in the bank.

The most successful finance teams ensure their billing system provides a single source of truth for contract terms, invoicing and revenue recognition. They connect their CRM and ERP so that finance has full

control over the numbers, while sales teams continue using the CRM tools they need for quoting and deal tracking.

In practice, this means automation replaces manual handovers: contract details flow through to billing without re-entry, real-time reporting replaces end-of-month spreadsheet amalgamations, forecasting becomes easier and compliance isn't a fire drill at quarter-end.

"The ERP only knows what the ERP knows. If it doesn't know what the contract is, it doesn't know what the revenue is. It doesn't know what the billing cadences are. If it doesn't know these things, it can't effectively account for them."

– **James Hewitt**, Finance leader and NetSuite ERP expert

Ask yourself:

- ◆ Does our billing system provide a single source of truth for contract terms, invoicing and revenue recognition?
- ◆ Can finance track revenue obligations in real-time or does it require manual effort to bridge gaps between systems?
- ◆ How many manual steps are required to ensure invoicing reflects contract obligations accurately?

If the answers raise more questions than confidence, **this checklist** helps uncover whether your third-party tools are creating more complexity than clarity inside NetSuite.

2. They involve finance early in defining billing workflows.

One major misstep companies make is bringing finance into billing conversations only after problems surface (e.g. a revenue recognition issue or a reporting discrepancy). Leading organizations connect their finance and sales operations from the start. Finance is involved in how products and contracts are configured in the CRM/CPQ, ensuring the billing and revenue implications are understood upfront.

By collaborating on the design of billing workflows, these companies avoid nasty surprises. For instance, they prevent tax calculation issues on invoices (especially when selling in multiple jurisdictions), because finance has built those requirements into the process. They reduce manual revenue adjustments, because sales isn't selling something that finance can't properly account for.

Essentially, sales and finance speak up early to make sure a deal that is closed in the CRM can be billed and recognized cleanly in the ERP. This alignment early on saves a ton of cleanup later.

“By automating our billing operations [inside NetSuite], ZoneBilling ensured we’re no longer a bottleneck for the sales team’s complex deals. We can now confidently say ‘yes’ to their requests and handle everything seamlessly without any additional manual burden.”

– **Lakshman Manoharan**, Head of Business Systems at Lattice

Ask yourself:

- ◆ Are contract terms in CRM or CPQ designed with finance input or does billing have to adjust them manually post-sale?
- ◆ Does finance define how revenue is structured – or are they forced to clean up inconsistencies later?

3. They design billing with flexibility in mind.

Thriving finance teams design billing to flex with change – without compromising control. For example, in usage-based models, the inputs for a specific product may change due to ramped pricing, tiers and discounts. What doesn’t change is the revenue rule agreed upon with the auditors for that product. The inputs are variable. The rule is not.

If that rule isn’t enforced consistently – because billing lives outside the ERP or is managed across disconnected tools – the gaps create risk in the balance sheet. That’s the challenge with fragmented systems: they create flexibility without guardrails.

“If every pricing change means finance has to build another workaround, that’s not a scalable billing model – it’s a bottleneck.”

– **James Hewitt**, Finance leader and NetSuite ERP expert

A flexible billing system design accommodates new scenarios (like adding a usage charge to an existing subscription or merging billing for a new entity) by making configuration changes within the same control environment – not custom-building around it.

The integration between CRM, CPQ and ERP is set up so that billing stays accurate no matter what’s thrown at it next. Companies doing this right often say that instead of saying “no” or scrambling when sales proposes a complex deal, they’re able to support it smoothly. Automation catches things like proration, tiered pricing or discounts so finance isn’t recalculating those manually in spreadsheets.

What we've seen:

A **fast-growing SaaS company**, initially relied on multiple disconnected systems, including NetSuite, Salesforce and Stripe, for their finance functions. Billing was manual and resource-heavy, requiring multiple billing specialists and causing invoicing delays. After switching to ZoneBilling and ZonePayments inside NetSuite, they cut billing time by 90%, reducing daily workload from four hours to less than two – and the process is now managed by a single person. They also gained flexibility with subscription changes, ensured accurate prorated calculations, automated payment application, improved financial accuracy and strengthened compliance and control.

“The leap from our previous system to now has been night and day for prorated calculations. We've bridged the gap between Salesforce and our billing system in NetSuite thanks to ZoneBilling.”

– **Lakshman Manoharan**, Head of Business Systems at Lattice

Ask yourself:

- ◆ Can our system track new revenue models without finance manually adjusting reporting?
- ◆ Can finance implement pricing changes without manual intervention?
- ◆ When a new entity or product line is added, does billing adjust automatically – or does finance have to step in and fix a misalignment?

4. They build billing to scale with company growth.

Often, billing complexity doesn't grow linearly – it jumps in leaps when something big happens (new markets, a surge in customers, acquisitions). Best-in-class finance teams don't wait for things to break to address scalability. They proactively set up billing processes that can handle growth. This means having systems and workflows that won't buckle under 10x transaction volume and that support multi-entity, multi-currency scenarios out of the box.

Yet many companies don't re-evaluate their billing setup until billing errors, reporting delays, compliance gaps or forecasting errors become impossible to ignore. They keep adding more manual steps and disconnected tools until finance is buried in workarounds – usually using spreadsheets to fill system gaps and reconciling transactions twice – once in the billing tool, once in the ERP.

"I've seen finance teams spend weeks reconciling revenue because their billing system wasn't built for scale. That's a huge financial risk, not just a reporting issue."

– **James Hewitt**, Finance leader and NetSuite ERP expert

Effective billing should scale automatically with transaction volume – not force finance to work harder just to keep up. It should support cross-entity operations, multiple currencies and changing business models without adding complexity to finance operations.

Scaling billing without workarounds.

A renewable energy company grew through acquisitions and partnerships, but its manual invoicing process couldn't keep up. Booking revenue took eight hours a day and invoicing delays stretched to three weeks. Moving billing into their ERP with ZoneBilling cut revenue booking time by 94% – from eight hours to 30 minutes. It also gave them site-level revenue tracking and removed the invoicing bottleneck.

"We needed something flexible... We needed to track and bill on the site level. We chose Zone because of the level of customization that we knew we would have to do. And we felt that ZoneBilling would be able to handle that customization with a higher degree of flexibility than maybe a more rigid tool."

– **Sandro De Ciccio**, VP Controller at Power Factors

Ask yourself:

- ◆ Does billing support growth – or does every increase in transactions require another workaround?
- ◆ When we expand into new markets or entities, does billing scale automatically?
- ◆ Are revenue and cash flow forecasts reliable – or are they delayed by reconciliation issues?

5. They automate to remove risk, not just inefficiency.

Manual billing creates inefficiencies. More importantly – it exposes vulnerabilities. Invoicing errors. Revenue recognition mismatches. Unreliable audit trails. Compliance gaps that only surface when auditors start asking questions.

Forward-thinking finance teams automate processes like invoicing, revenue scheduling and payment reconciliation specifically to eliminate human error and enforce compliance. They recognize that every manual step is a potential failure point – an incorrect formula, a missed update or an inconsistent application of policy.

We've seen finance teams spending hours in Excel reconciling deferred revenue, manually tracking obligations and pulling reports from multiple systems just to answer simple forecasting and reporting questions.

And many of these issues aren't caused by finance – but by fragmented systems. When contract terms, revenue schedules and compliance workflows are spread across CRM, spreadsheets and disconnected billing tools, finance is left stitching data together. It's hard to ensure completeness or accuracy in that scenario.

“Without ZoneBilling, we would not have been able to support our customer growth without significant back office effort and a high chance of failure.”

– Blair Woodbury, CFO at Devoli

Companies that centralize billing and revenue operations inside their ERP (while letting the CRM handle sales-facing workflows) remove those blind spots. By doing so, they create a controlled, audit-ready process end to end.

- ◆ The finance team can trust the numbers because the process is systematic and governed by the ERP's rules.
- ◆ Invoices don't go out with errors because they're generated from a single source of truth.
- ◆ Revenue isn't recognized incorrectly because the system automatically applies the rules as transactions occur.

In short, smart automation underpins accuracy and compliance.

Ask yourself:

- ◆ Can finance trust the numbers – or does reporting require constant validation?
- ◆ When an auditor requests supporting documentation, can finance pull it instantly – or does it require time-consuming data gathering from multiple sources?

Having looked at these best practices, you might notice a recurring theme: centralizing billing within the ERP and tightly integrating it with sales processes tends to address the challenges we listed earlier.

Next, let's delve into what an ERP-centered billing approach actually delivers in terms of capabilities and outcomes and how it tackles those pain points.

The foundation for financial control: What ERP-based billing delivers

In our experience, the most successful approach is to make your ERP “contract-aware” – meaning the ERP holds a central contract record that drives both billing and revenue recognition. When your financial system knows all the details of each deal, it becomes that single source of truth for all post-sales operations. Here's what that enables:

a) Contract awareness within the financial system

When your ERP holds all key contract information (e.g. products, quantities, prices, terms, renewals), it lays the groundwork for automating billing and revenue recognition.

- ◆ The finance system has a 360° view of what was sold, to whom and under what conditions, without needing to reference the CRM.
- ◆ If a contract includes a usage-based component, that usage data can flow into the ERP's contract record, enabling accurate usage billing.
- ◆ Finance can see, in one place, the upcoming billing schedule, any deferred revenue tied to the contract and the performance obligations that need tracking.

This contract-centric approach breaks down the silos that plague disconnected systems. Rather than duplicating data or reconciling across platforms, all the crucial info lives in one record in one system.

b) Automated, integrated revenue recognition

With contract data centralized, the ERP can handle revenue recognition in strict accordance with ASC 606/IFRS 15 (or any standard your company follows).

The system can automatically allocate revenue based on the performance obligations and timing in the contract. Finance no longer needs separate spreadsheets or manual journal entries to spread revenue or enforce rules across systems (billing and revenue triggers are in sync).

"You cannot fully automate and streamline your revenue recognition process if you use a third-party billing tool outside of NetSuite. It simply cannot be done."

– James Hewitt, Finance leader and NetSuite ERP expert

c) Unified financial processes (quote-to-cash alignment)

When billing lives inside the ERP, all downstream financial processes benefit.

Invoicing, collections, cash application and even general ledger postings become part of one continuous workflow.

- ◆ Invoices generated from an ERP-based billing module can immediately follow the ERP's rules for tax calculation and GL coding. There's no "handoff" where data might get misinterpreted.
- ◆ Cash receipts can be automatically matched to those ERP invoices because they're in the same system.
- ◆ Deferred revenue ledgers update instantly as invoices and revenue schedules are posted.

If your business operates across multiple entities or currencies, an ERP-centric process will automatically handle currency conversions, intercompany transactions and consolidation entries as part of its normal operation – instead of finance doing those adjustments after the fact. In short, billing stops being a separate island and instead becomes an integrated piece of your core financial operations.

d) Real-time insights and reporting

An ERP-centered billing approach gives finance real-time visibility into key metrics without manual data assembly.

At any given moment, you can see how much has been billed, how much revenue has been recognized, what's in deferred revenue and what cash has been collected, all through your ERP's reporting tools

What else can you expect with this automation?

- ◆ Customers get billed for exactly what they consumed or are entitled to (no more, no less).
- ◆ Volume or tiered pricing is applied correctly without finance recalculating it offline.
- ◆ Revenue is recognized only when it should be (for example, if a customer prepay but hasn't used the service, the revenue remains deferred automatically).

- ◆ Because billing and revenue events are recorded as they happen, dashboards and reports can be kept up-to-date automatically. This drastically improves the quality of forecasting and decision-making.
- ◆ Finance can trust that a report on, say, bookings vs. billings vs. revenue is accurate because all three of those data points come from the same unified source.

Essentially, real-time data means no end-of-period surprises – issues can be spotted and addressed sooner.

If the CFO asks mid-quarter “where do we stand?” or if there’s a need to model the impact of a change (like a big customer renewal or cancellation), having everything in one system makes those analyses straightforward.

e) Simplified compliance and audits

With financial data centralized, compliance checks and audits become much easier. Auditors (or internal compliance teams) can trace a straight line in one system **from a customer order, to the invoice, to the revenue recognition entry, to the cash receipt.**

There’s a complete and automatic audit trail.

Standard compliance requirements like SOX are easier to meet because controls (approval workflows, change logs, segregation of duties) can be enforced within that one system.

And because everything is standardized, audit sampling and testing take less time (often translating to lower audit fees).

If an auditor asks for documentation on revenue for a particular contract, finance can pull up the contract record in ERP (NetSuite, for example) and show all related invoices, revenue schedules and even the payments – without jumping between different software.

This level of transparency is very hard to achieve when billing is fragmented. By centralizing, companies reduce the risk of compliance issues and also reduce the overhead (time and cost) of proving compliance.

In summary, embedding billing in the ERP and making the ERP contract-aware provides a solid foundation for financial control.

Finance regains ownership of the process without inhibiting sales. Still, the goal isn’t to make it ERP vs. CRM in a tug-of-war. The goal is to connect them in the right way.

In the next section, we discuss how companies bridge that gap – linking CRM and ERP so that each system does what it’s best at, and the handoff between them is seamless.

Bridging the gap: Connecting CRM sales tools with ERP finance systems

The most successful billing architectures don't force a strict either/or choice between CRM and ERP. Instead, they integrate the two, allowing each system to play its ideal role. The CRM handles what it's great at (customer relationships, quotes, initial contract capture) and the ERP handles what it's built for (billing, accounting, revenue). The key is clearly defining the handoff points and ensuring data flows smoothly between the systems.

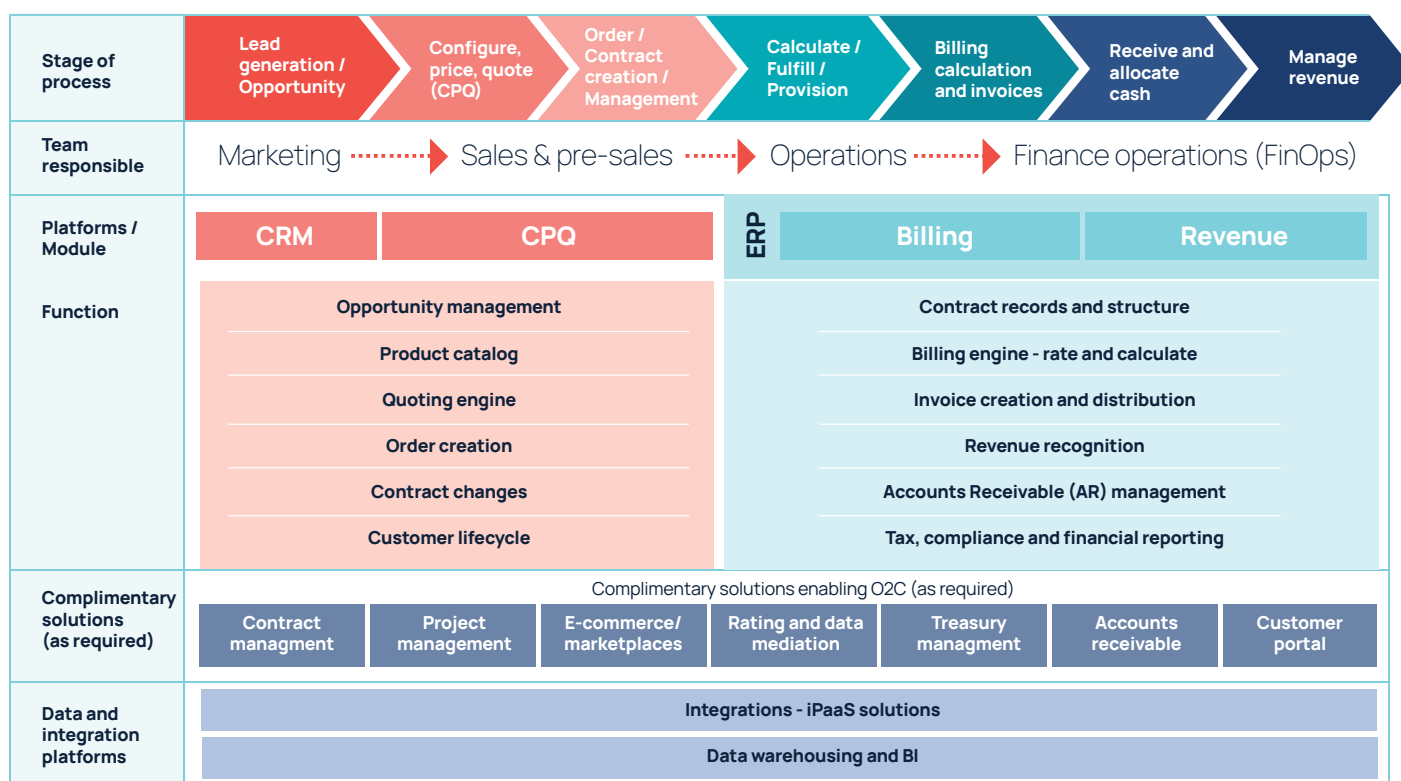

Figure 1 – Best practice end-to-end architecture of a B2B order-to-cash model across business functions and finance systems

Clear system responsibilities

In a best-practice setup, you'd define exactly what happens in each system so there's no confusion or overlap.

For example:

CRM owns the deal terms before the contract is signed.

- ◆ Customer acquisition and relationship management (opportunity data, customer info)
- ◆ Quoting engine and proposal generation
- ◆ Contract creation and changes during the sales cycle

Essentially, everything related to the sales cycle and negotiation lives in the CRM or CPQ platform.

ERP owns the contract once it's closed and signed.

- ◆ Contract records and structure (acts as the "source of truth")
- ◆ Billing calculations based on contract terms
- ◆ Contract amendments, renewals and deferrals
- ◆ Revenue recognition
- ◆ All financial reporting and compliance

Everything post-sale and finance-related lives in ERP.

This split of responsibilities allows the sales team to continue working in their preferred environment (CRM/CPQ for deals and customer management), and finance can trust that once the deal is closed, it will be carried out in the ERP with full control and visibility. Sales stays focused on closing deals. Finance gets complete and accurate data downstream.

Contract as the connection point

The strongest integrations use the contract as the "bridge" between CRM and ERP. When a deal is finalized in the CRM/CPQ, that contract (and all its line items, dates and conditions) is transmitted into the ERP as a new contract record.

Think of it as a handshake: the CRM hands off a contract to the ERP. From that point on, the ERP drives all billing and revenue events for that contract. If done correctly, the contract in the ERP mirrors what was sold in the CRM, creating consistency.

This means when an invoice is sent or revenue is booked, it's directly tied back to the original agreement that sales made, without gaps. If someone needs to see why a customer was billed a certain amount, they can look at the contract in the ERP and see the exact terms, instead of having to reconcile it with a separate sales document.

"The leap from our previous system to now has been night and day for prorated calculations. We've bridged the gap between Salesforce and our billing system in NetSuite thanks to ZoneBilling."

– **Lakshman Manoharan**, Head of Business Systems at Lattice

Bi-directional updates

Integration shouldn't be one-way. Contracts change. A customer might upgrade mid-term, extend their contract or need a billing schedule adjustment. Ideally, changes can be initiated from either side and stay in sync.

If sales upsells an existing customer and amends the contract in the CRM, that change (the new product or quantity, etc.) should flow into the ERP contract record automatically and adjust future billings.

If finance extends a contract's end date in the ERP (say to accommodate a customer concession or to align with a revised renewal date), that update should push back to the CRM so sales sees the new end date and terms. This two-way sync ensures everyone – sales, finance, customer success – is working off accurate, current information.

"If you have variable revenue recognition rules, usage dependencies or complex contract terms, an external billing tool won't be able to automate revenue recognition inside your ERP. Those nuances will always be lost in translation."

– **James Hewitt**, Finance leader and NetSuite ERP expert

We discussed this and more in our webinar on [managing complex revenue in NetSuite](#). In that video, we also show how implementing flexible processes for contracts, subscriptions and revenue recognition can help combat churn and improve customer loyalty. If you're interested in the finer points or real-world demonstrations, feel free to check it out.

In summary, CRM platforms (especially with CPQ add-ons) are excellent for empowering sales teams to quote deals and manage customers. Meanwhile, a best-in-class ERP like NetSuite is purpose-built to give finance teams control, compliance and scalability for accounting operations.

Did you know?

In many of the B2B companies we've worked with (especially those in SaaS or fintech), our recommendation is to keep the **billing and revenue management in the ERP** and integrate the CRM to it.

Why? Those companies often have dynamic elements like:

- ◆ Usage-based charges and metered billing
- ◆ Tiered or volume-based subscription plans
- ◆ Contract change orders (upsells, downsells)
- ◆ Cancellations and renewals
- ◆ Deferred revenue arrangements and schedules
- ◆ Multi-entity or multi-currency billing needs
- ◆ Performance-based or milestone-based obligations

Handling these in an ERP environment gives finance the control and audit trail it needs for such complexity.

Bridging the gap between them means **connecting these strengths**: letting the CRM feed accurate contract and transaction data into the ERP, and letting the ERP handle the heavy lifting of billing, revenue and reporting – all without manual intervention. When done right, neither team has to leave their system of choice and the organization achieves a seamless quote-to-cash process.

Executing the shift: How finance teams embed billing in the ERP with ZoneBilling

At a certain point, billing workarounds stop working. Maybe an acquisition brings in new subsidiaries, currencies and contract structures that a CRM-based system can't handle. Maybe investors or the board start asking for faster closes, real-time revenue tracking and tighter financial controls. Or maybe the finance employee who managed all the manual workarounds leaves suddenly, and invoicing slows to a crawl.

When that moment comes, many companies move billing inside NetSuite with **ZoneBilling**. As a **SuiteApp** built inside the ERP, it makes NetSuite "contract-aware" and automates complex billing at the source – eliminating the risks of managing subscriptions, usage-based pricing and revenue recognition outside the financial system of record.

With billing fully embedded in NetSuite:

- ◆ **Data moves seamlessly from order to cash** – No external reconciliations. No duplicate data entry. **No manual syncing** between CRM, CPQ and ERP.
- ◆ **Invoices go out faster, with no errors** – Mid-term contract changes, tiered pricing, volume discounts and usage-based charges are **applied automatically**.
- ◆ **Revenue recognition happens in sync with contracts** – No adjusting journal entries to fix timing mismatches.
- ◆ **Cash flow improves** – Invoices generate the moment a performance obligation is met.
- ◆ **Multi-entity, multi-currency complexities are handled natively** – Foreign exchange rates, tax compliance and subsidiary reporting stay in sync.

- ◆ **Financial data is always audit-ready** – Every transaction, contract change and revenue event is **traceable** inside NetSuite.
- ◆ **Real-time insights, no manual reports** – Finance can track bookings, billings and revenue in a single view.
- ◆ **Scalability for global operations** – Whether **expanding** into new regions or handling higher transaction volumes, billing processes scale without requiring new external tools or complex integrations.

Finance teams that have made the switch have seen immediate impact – they cut billing cycles by as much as **80%**, reduced revenue recognition workloads by **70%** and eliminated the need for manual invoice reconciliation.

Board and investor expectations:

When private equity firms invest, they don't just expect growth. They expect control. Faster closes. Real-time revenue tracking. Predictable ARR. That's hard to deliver when billing lives outside the ERP.

Instead of chasing numbers, finance needs to prove them. With ZoneBilling, ARR, expansion revenue and contract changes are always visible inside NetSuite. Finance teams meet investor expectations – without the last-minute scramble.

For companies managing recurring revenue, usage-based pricing or multi-entity billing, the risks of keeping billing outside the ERP add up fast. Manual processes break at scale. Reconciliation takes longer. Reporting gaps create audit risks.

ZoneBilling eliminates those risks. Instead of finance chasing data across systems, everything – from contract terms to cash collection – stays inside NetSuite. That means faster closes, cleaner audits and the ability to scale without adding manual work.

The ROI benefits of billing within the ERP

To illustrate the financial impact of ERP-centric billing with ZoneBilling, let's consider a hypothetical SaaS company as an example.

This company processes about 1,000 invoices per month (with an average of 20 line items each) and generates around \$150 million in annual revenue. The finance team currently has four full-time employees managing billing and two dedicated to revenue recognition. Like many companies using external billing tools, they experience roughly a 3% billing error rate – leading to about 30 invoice corrections every month.

By switching to an ERP-based billing system, this company realizes the following savings and improvements:

- ◆ **\$150,000 per year in billing efficiency gains** – thanks to fewer manual processes, improved data accuracy and the ability to scale billing without hiring additional staff

- ◆ **\$47,500 per year saved in revenue recognition processes** – by reducing reliance on spreadsheets and manual journal entries to handle revenue allocations
- ◆ **\$1.23 million in improved cash flow** – due to a reduction in DSO through faster invoicing and automated, timely revenue recognition (meaning cash comes in sooner)
- ◆ **\$147,945 per year saved from better cash flow management** – by shortening the time between invoicing and collection, they diminish the financial impact of delayed payments
- ◆ **\$12,980 per year saved by reducing billing errors** – with fewer invoice disputes, adjustments and reissued invoices consuming time and resources
- ◆ **\$150,000 per year in prevented revenue leakage** – by catching what used to be lost revenue (for instance, missed chargeable items or lapsed renewal uplifts) that would slip through in a fragmented system

The bottom line: That's about **\$508,000 in total annual savings**. Over three years, this translates into roughly a **\$950,000 ROI** from moving to ERP-based billing.

Calculate your ROI: The exact financial upside of ERP-based billing will vary based on your business model, transaction volume and pricing complexity. You can use the **ZoneBilling ROI calculator** to estimate your own cost savings and ROI from bringing billing into NetSuite. It's an easy way to plug in your numbers and see the potential impact for your organization.

The key takeaway: Billing belongs where finance has control.

Every workaround, every spreadsheet, every manual revenue adjustment usually points back to one issue: billing processes designed around sales, not finance. When billing lives outside the ERP, finance ends up reconciling data it didn't create, chasing accuracy across disconnected systems and trying to meet investor expectations with incomplete information.

Did you know?

With finance automation inside the walls of NetSuite, our customers typically see the ROI in 6-9 months through:

- ◆ **90% increase in billing efficiency** with real-time data sync between NetSuite and Salesforce
- ◆ **100% bank reconciliation accuracy** and faster month-end close
- ◆ **75% faster bill turnaround**
- ◆ **Three months of payroll admin cut** each year
- ◆ **Zero system sync delays**

What we've seen is consistent: **The finance teams that scale successfully – without losing control – are the ones that embed billing in their ERP.** That decision gives them:

- ◆ **A contract-aware financial system** that eliminates gaps between deal terms, invoices and revenue recognition
- ◆ **Real-time data** they can trust for forecasting, audits and reporting
- ◆ **Automation that removes risk** and enforces compliance, instead of just saving time
- ◆ **Flexibility to support complex pricing**, multiple billing models and multi-entity growth – without custom-built workarounds

Billing is where revenue starts – and where finance accountability begins. If finance isn't in control from the moment a deal closes, accuracy, compliance and visibility will always be compromised. If your current billing setup can't support that level of control, it's time to reconsider where billing lives – and who it's really working for. We hope this whitepaper helps you evaluate if ERP-embedded billing fits your finance strategy. The right choice for you might mean fewer workarounds, better compliance and stronger financial control.
